To include a yellow note into a document insert the code:

```
\yellownote{
   Message into a yellow note. We just want to see how it
   will look.
}
```

Message into a yellow note. We just want to see how it will look.

and you will see the first yellow note at the margin of the page. Include more text then...
This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test.
And when neccesary, change the size of the yellow note with the following command:

```
\resizeableyellownote{2.5}{1.5}{
   Resizeable yellow note.
}
```

Resizeable yellow note.

to get the second one... Each of the arguments are: `{width}{height}` in centimeters. You do not need to include the unit in the argument. The instruction already knows it. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test. This text is only a test.
I hope this help you improve your design.
